

Question1 : Write Css Code To :

- 1- matches an element if it matches any selector in its argument list. It simplifies repetitive selectors without writing them out separately.
- 2- matches an element if it matches any selector in its argument list. It simplifies repetitive selectors without writing them out separately. [Hint It's Called A Parent Selector]
- 3- matches elements that do not match the list of selectors provided

Question 2:

- 1- SS grid introduced a new length unit, fr, to create flexible grid tracks. Referring to the code sample below, what will the widths of the three columns be?

```
.grid {  
  display: grid;  
  width: 500px;  
  grid-template-columns: 50px 1fr 2fr;  
}
```

- 2- What is the difference between the following line-height settings?

```
line-height: 20px;  
line-height: 2;
```

- 3- Using the :nth-child pseudo-class, what would be the most efficient way to style every third item in a list, no matter how many items are present, starting with item 2?
- 4- Which selector would select only internal links within the current page?

```
a- a[href="#"]  
b- a[href~="#"]  
c- a[href^="#"]  
d- a[href$="#"]
```

- 5- The calc() CSS function is often used for calculating relative values. In the example below, what is the specified margin-left value?

```
.example {  
  margin-left: calc(5% + 5px);  
}
```

Good luck 😊
